

# Cancer Prevention and Early Detection for Community Health Centers

**Cervical Cancer Prevention & Screening:  
Pathways to Greater Access**

January 22, 2026

# Welcome

**Gabrielle Darville-Sanders, PhD, MPH, CHES**

Strategic Director, National HPV Vaccination Roundtable

# Agenda

## 1 **Why Access Matters: The Public Health Landscape**

**Speaker: Rebecca Landy, PhD**

## 2 **Cervical Cancer Screening and HPV Self Collection Guidelines**

**Speaker: Sarah Temkin, MD**

## 3 **Strategies and Tools to Increase Access**

**Speaker: Sarah Temkin, MD**

## 4 **Best Practice: Primary HPV Testing in a Mobile Clinic**

**Speaker: Tom Hutch, MD, FAAFP, FASAM**

## 5 **Q & A**

**Gabrielle Darville-Sanders, PhD, MPH, CHES**

# Polli

1. Almost all cases of cervical cancer are caused by high-risk types of human papillomavirus (HPV).
2. The 5-year relative survival rate is over \_\_% for cervical cancer diagnosed at a localized stage.
3. How would you describe your knowledge of cervical cancer prevention and screening?
4. How would you describe your knowledge of self-collection HPV testing?
5. My clinic has implemented HPV self-collection screening.

# Prevention & Early Detection

# The Natural History of Cervical Cancer

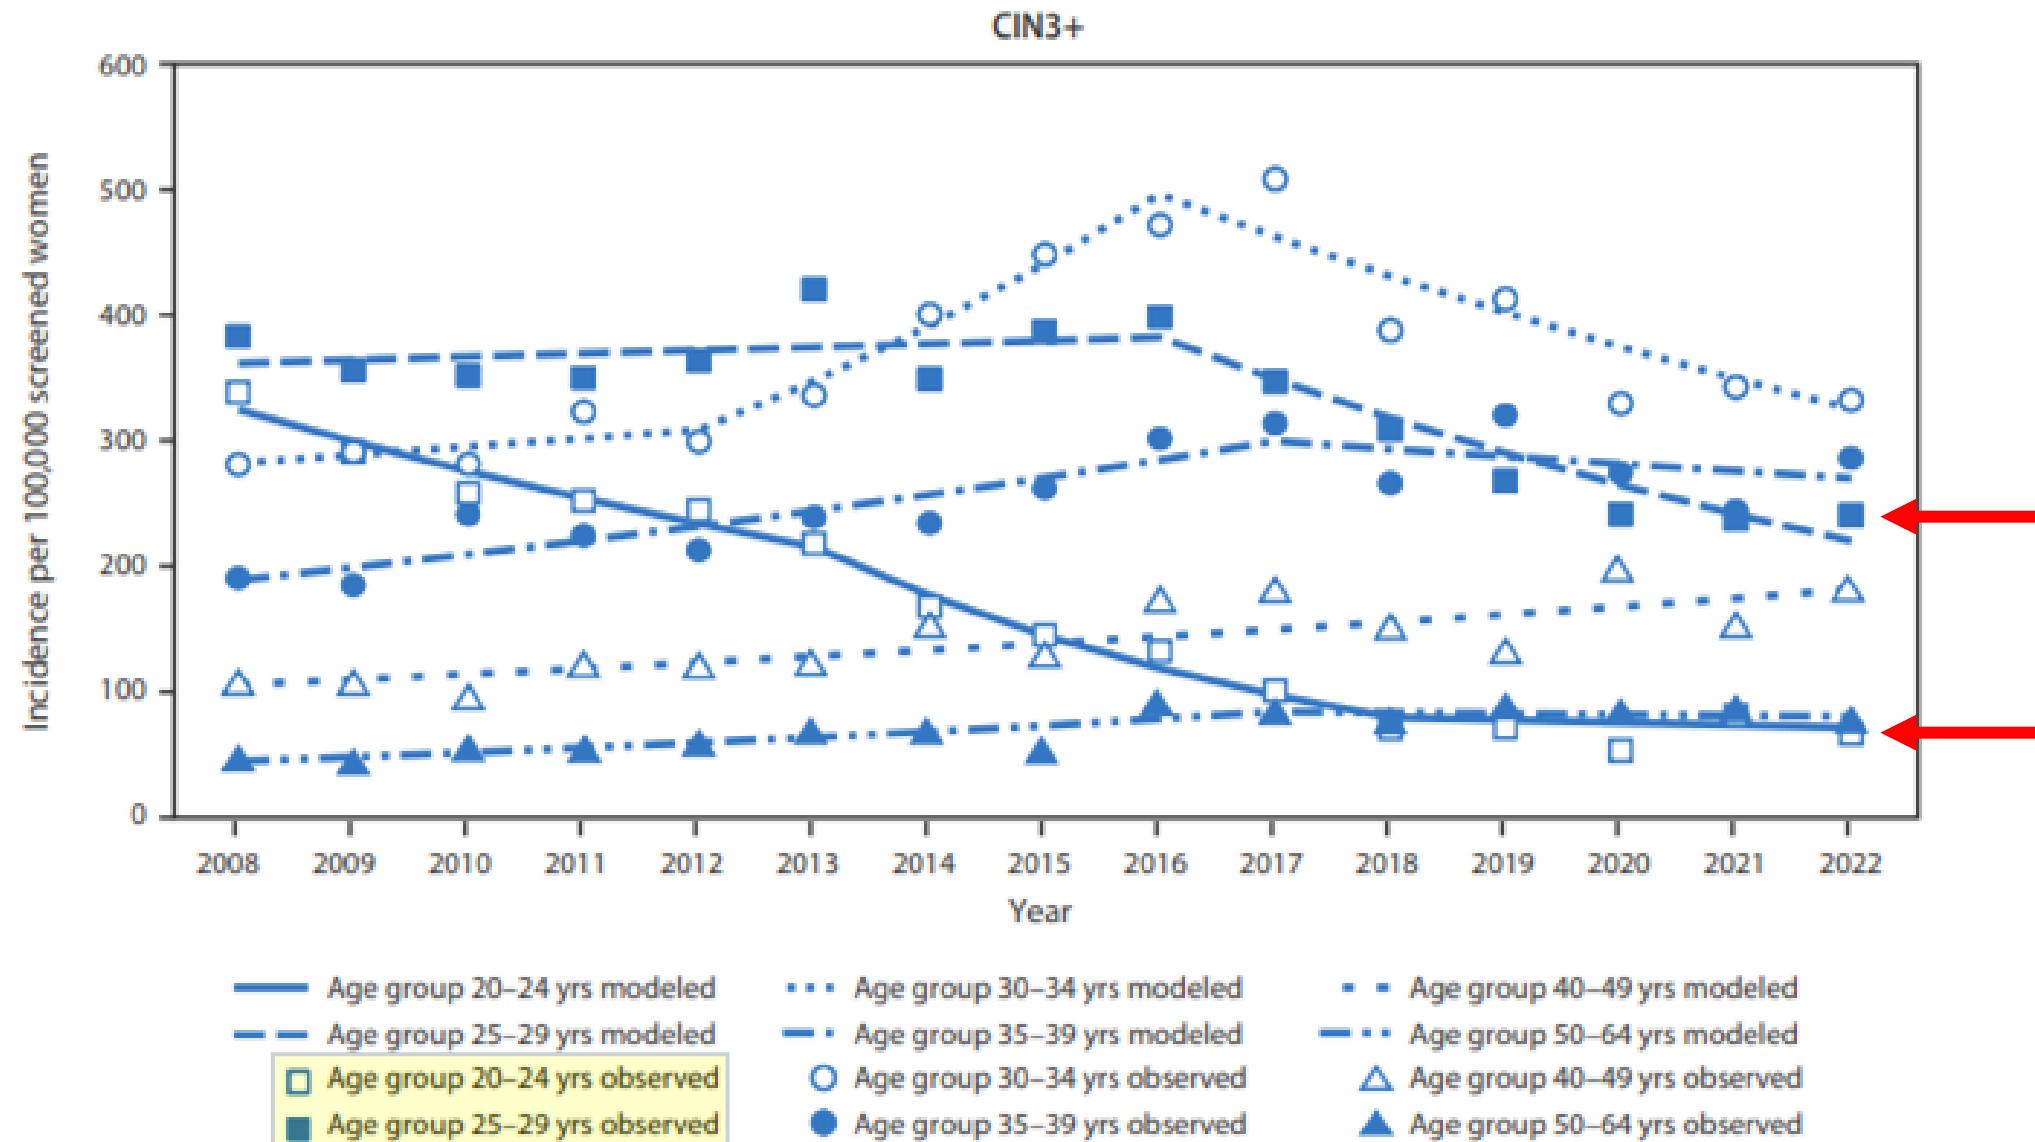

# HPV vaccination

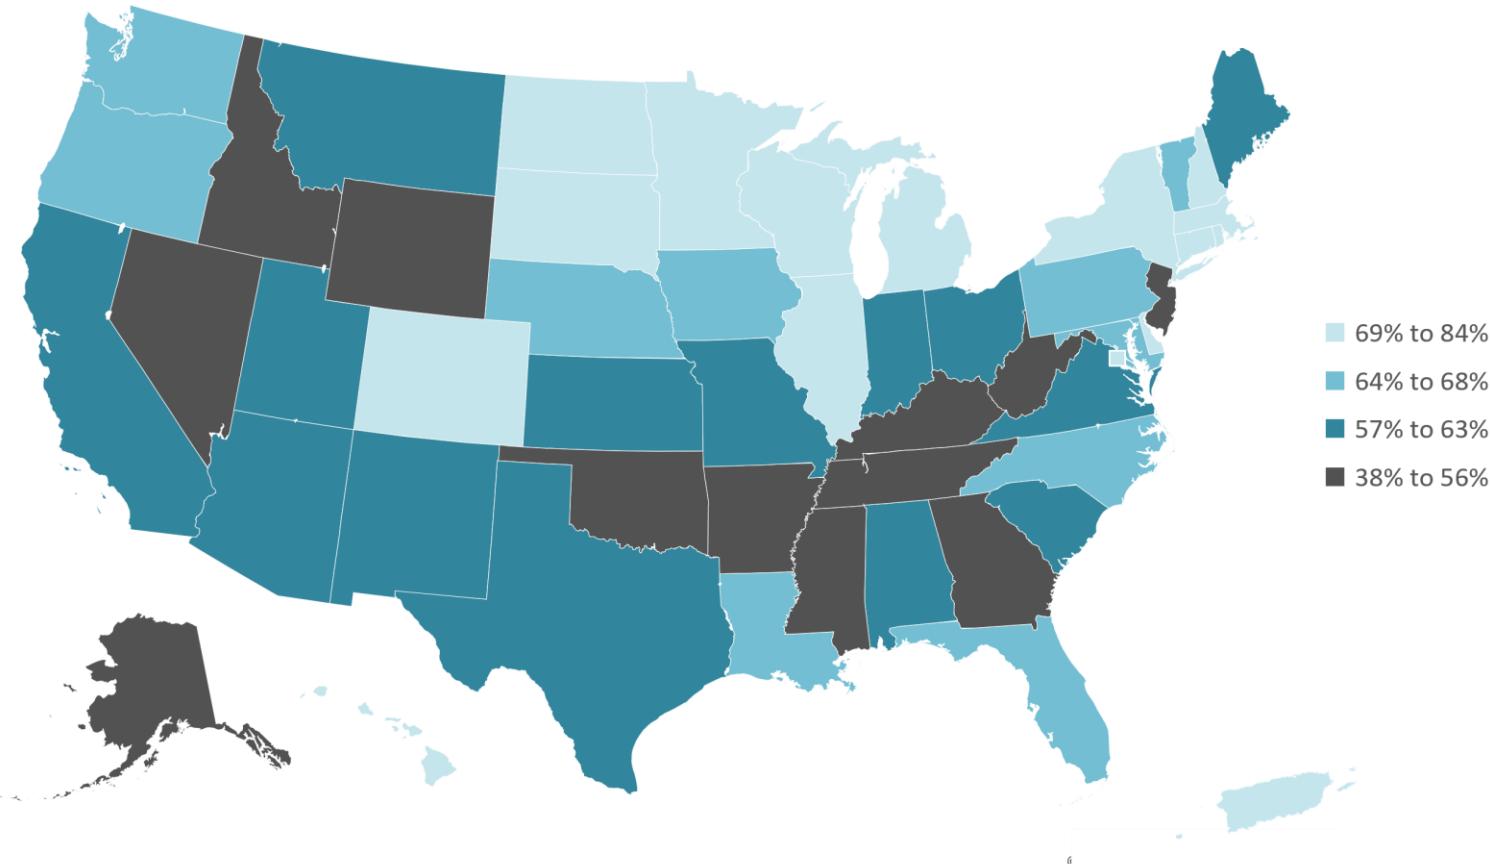

- Approved in the US since 2006
- Currently recommended for everyone aged 9-26, shared decision making ages 27-45 years
- In 2023, 65% of females and 61% of males aged 13-17 had received at least 1 dose before their 13<sup>th</sup> birthday <sup>1</sup>
- In 2022, 52% of female and 31% of male individuals aged 19-26 reported ever having received at least one dose <sup>2</sup>
- Estimated to reduce lifetime risk of cervical cancer by 85% if vaccinated by age 12 <sup>3</sup>
- Cancer Facts and Figures 2026: The rate of cervical cancer in women aged 20-24 years decreased by 11% per year since 2012

<sup>1</sup> National Immunization Survey-Teen, 2023; <sup>2</sup> National Health Interview Survey, 2022; <sup>3</sup> Kim et al, JNCI, 2017

**FIGURE. Incidence (cases per 100,000 screened women)\* of cervical precancers<sup>†</sup>—Human Papillomavirus Vaccine Impact Monitoring Project,<sup>§</sup> five sites, United States, 2008–2022<sup>¶</sup>**

# Up-to-date Human Papillomavirus Vaccination (%), Youth 13–17 Years, by State, US, 2023

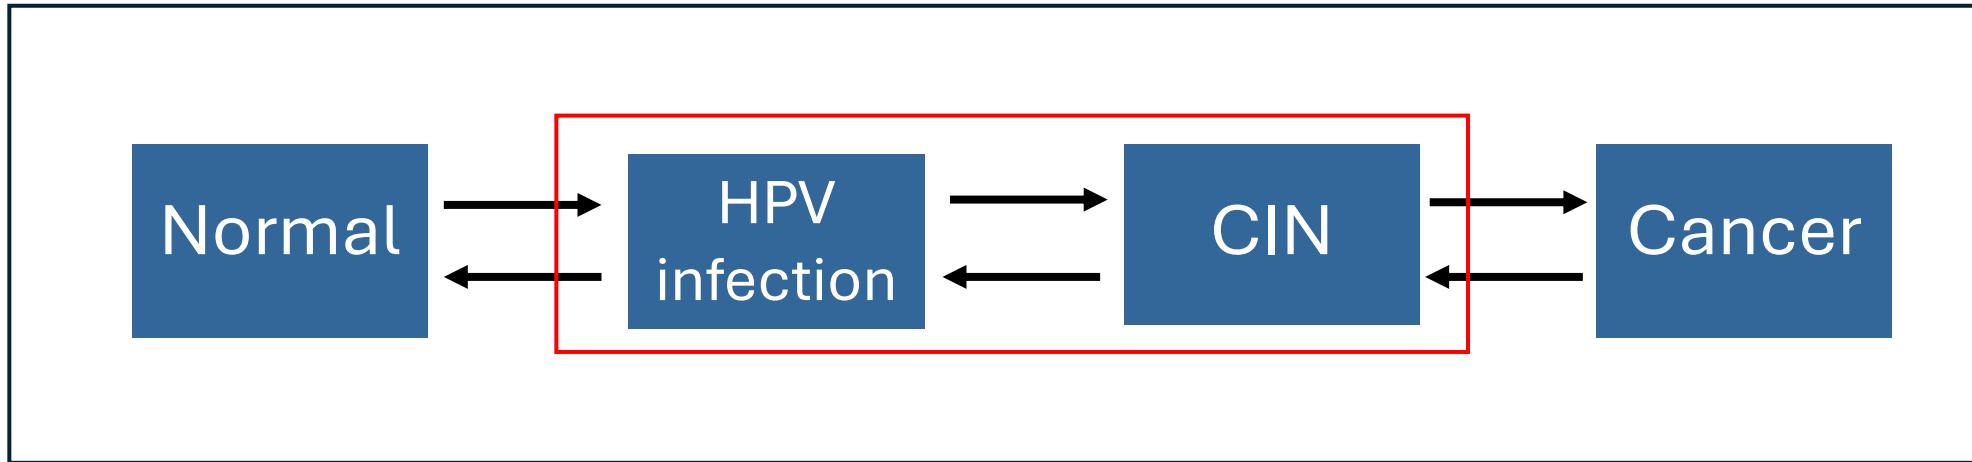

# Cervical Cancer Screening

Recommended for ages 21-65 (USPSTF) or 25-65 (ACS)

HPV testing – detect high-risk HPV infection, 5-year screening interval

Cytology/Pap testing – detect abnormal cells, 3-year screening interval

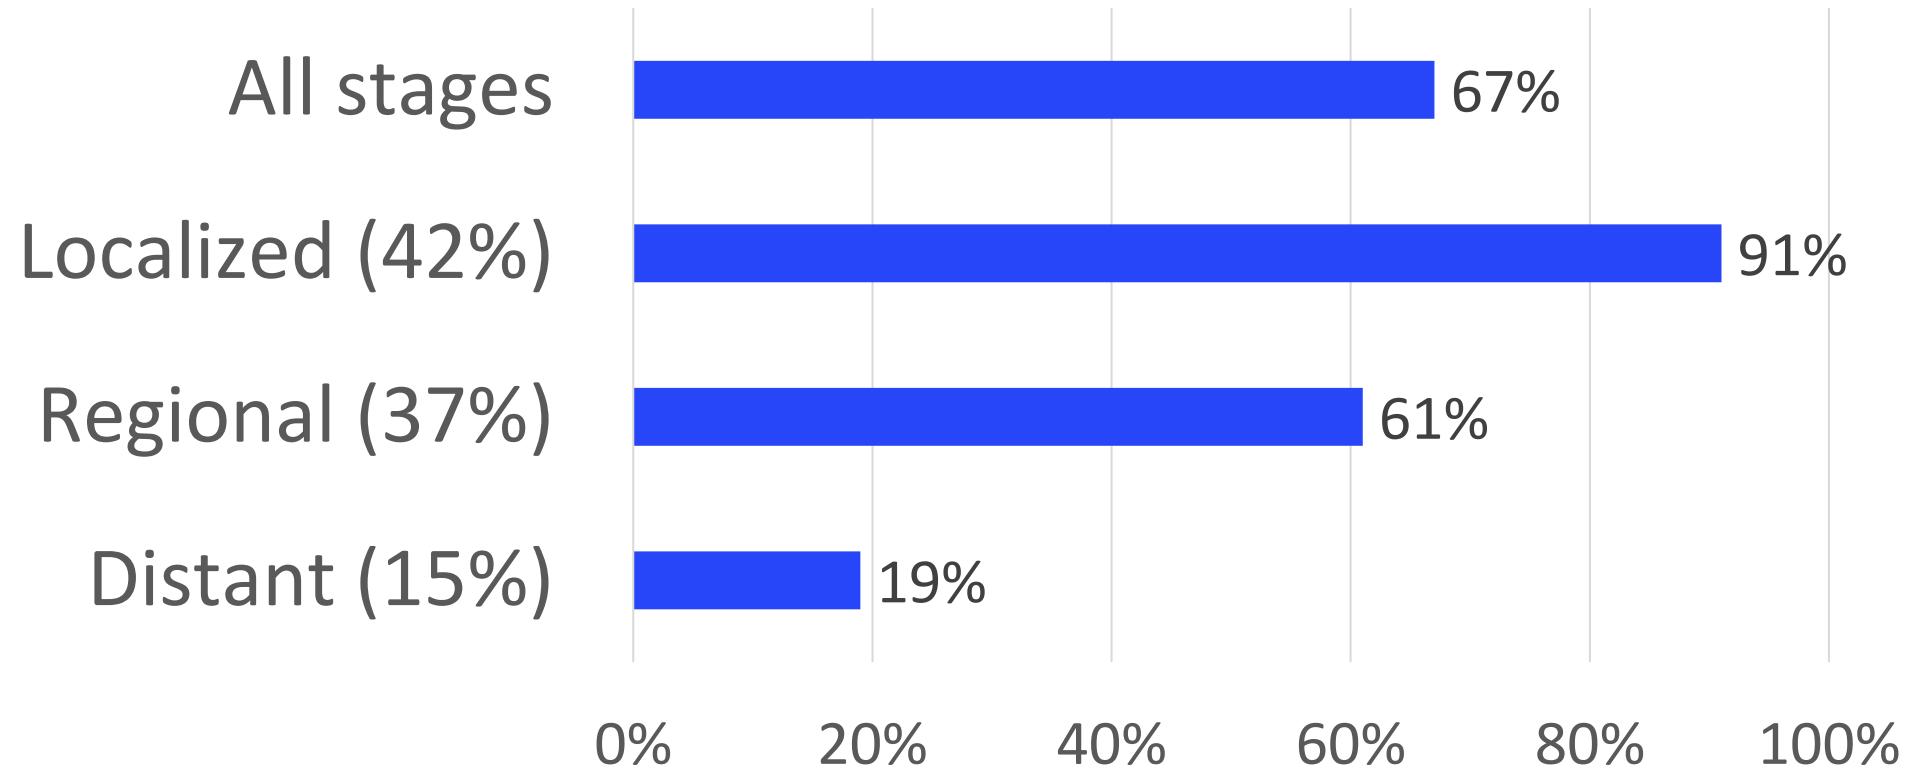

ACS guidelines updated in December 2025 to include self-sampling.  
Attending screening regularly is estimated to reduce the risk of cancer by 70%<sup>1</sup>

<sup>1</sup> Landy et al, International Journal of Cancer, 2020

# Early detection saves lives

## 5-year relative survival by stage at diagnosis, 2014-2020

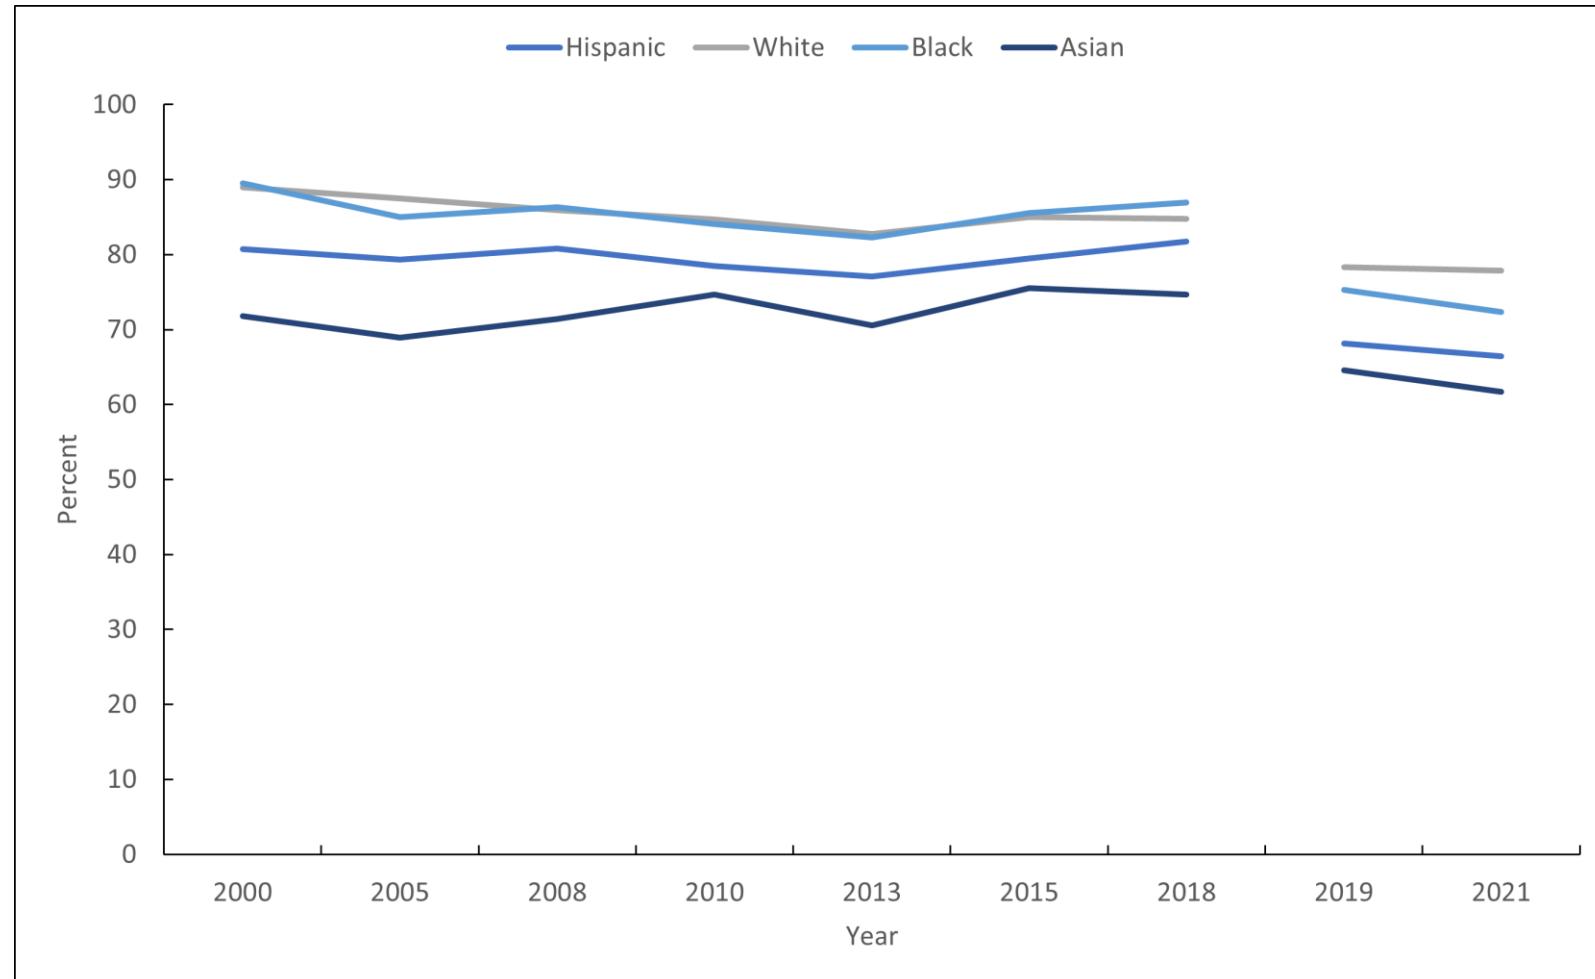

©American Cancer Society, 2025

Data source: Surveillance, Epidemiology, and End Results 22 registries, National Cancer Institute, 2024

Survival is adjusted for normal life expectancy and based on cases diagnosed 2014-2020 and followed through 2021.

## Trends in Cervical Cancer Screening\* (%) by Race/Ethnicity, Women 21 to 65 Years and Older, US, 1987–2021

Up-to-date with cervical screening (USPSTF) 2021: 73% overall:

56% for people with less than high school education, 83% for college graduates

63% for <100% federal poverty level (FPL). 77% for  $\geq 200\%$  FPL

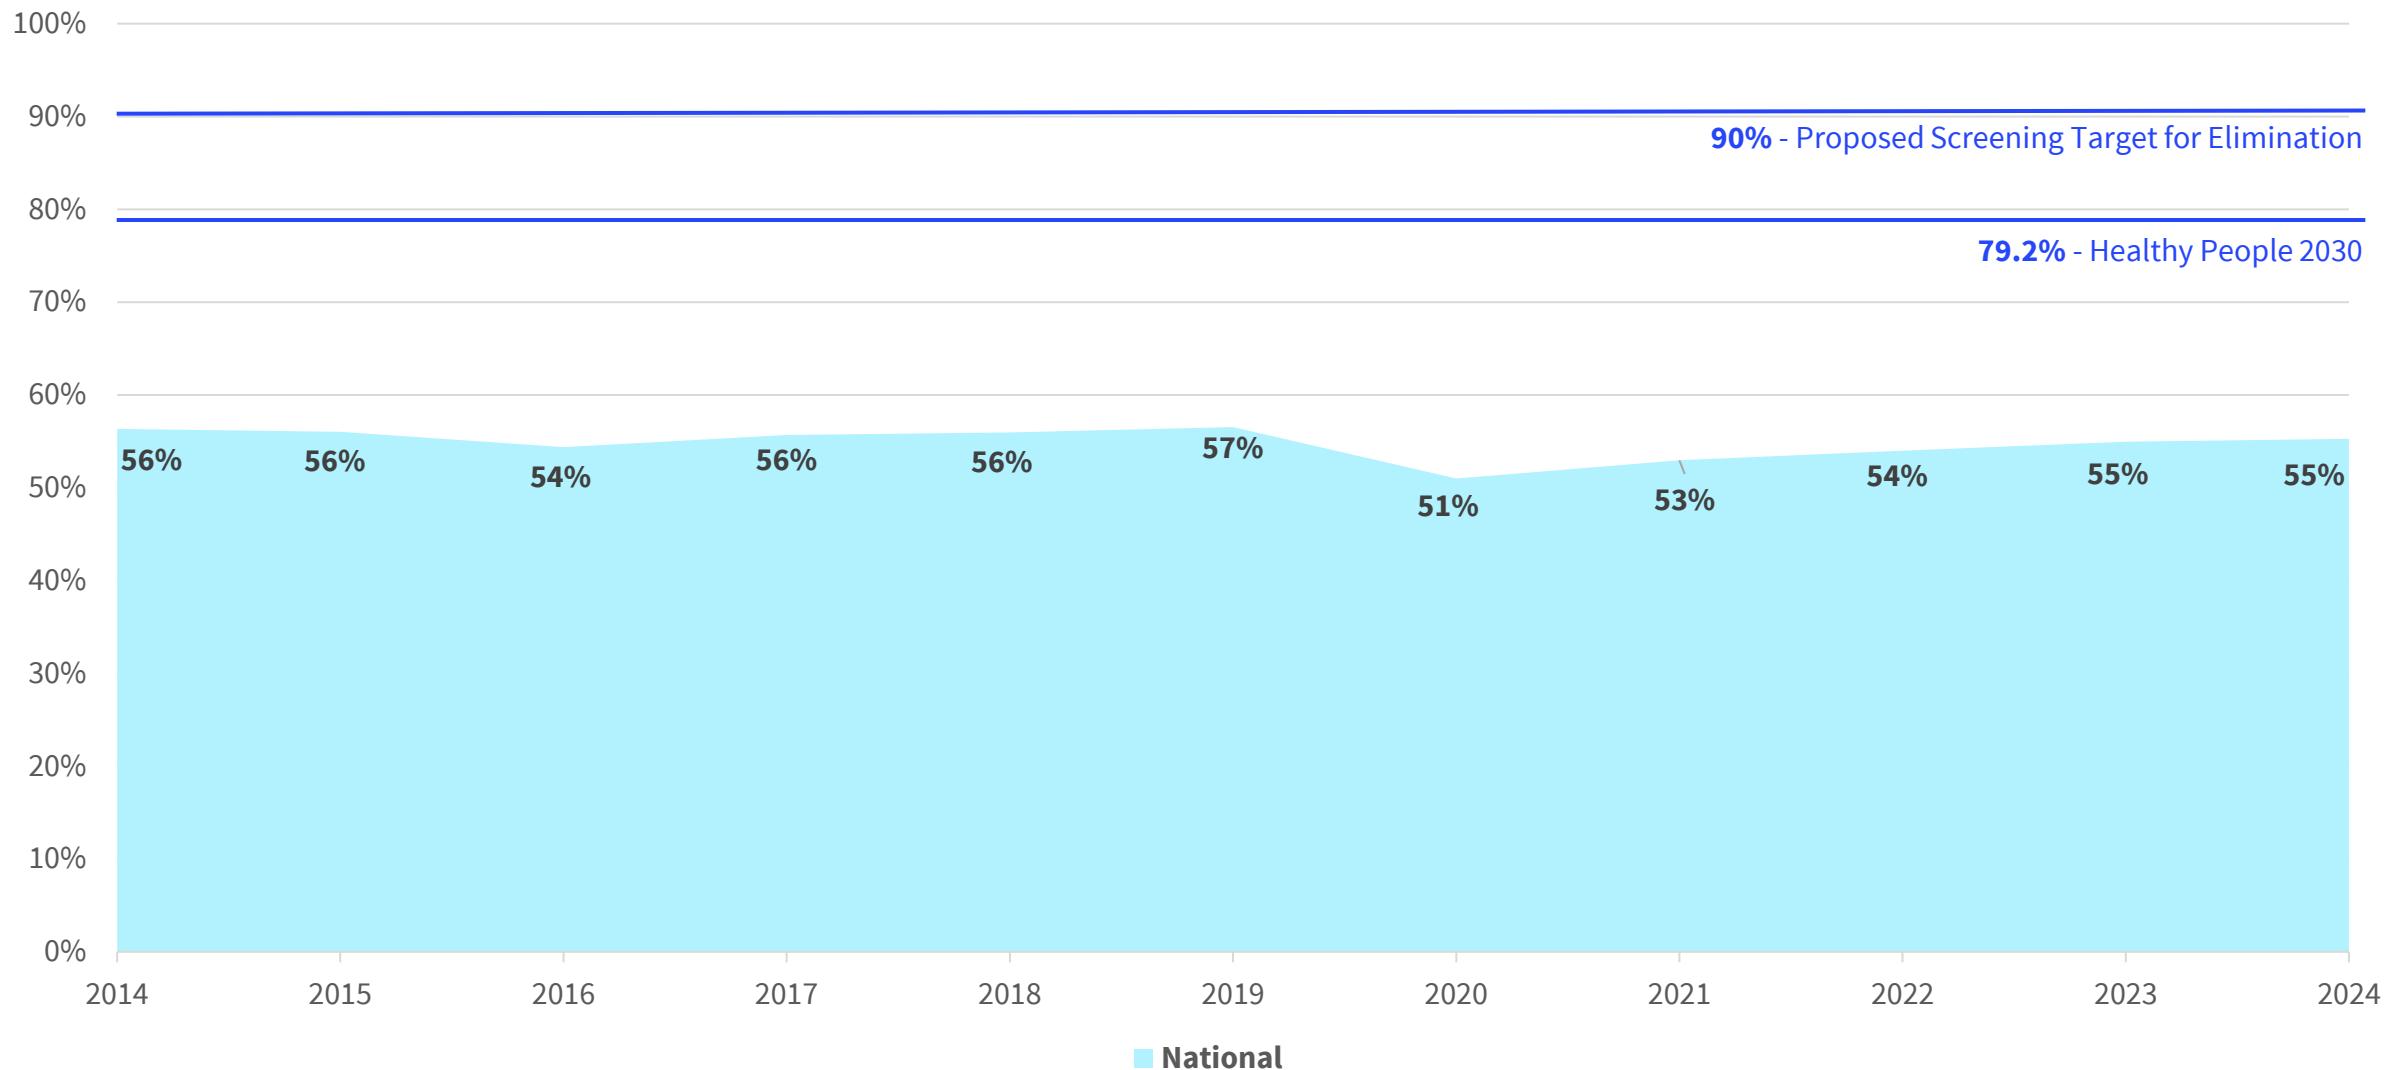

55% uninsured, 77% private

Information is adjusted to the year 2000 US population standard using 4 age groups: 21-29, 30-39, 40-49, and 50-65 years. The National Health Interview Survey (NHIS) underwent a significant redesign in 2019, preventing comparability to prior years indicated by the line break. \*Cervical cancer screening is defined as Pap test in the past 3 years (2000-2021) among females 21-65 years or HPV and Pap co-testing in the past 5 years (2015-2021) among females 30-65 years who have not had a hysterectomy; hysterectomy data not available in 2003. Up-to-date cervical cancer screening data not available in the NHIS 2023. Primary HPV testing estimates are not available due to questionnaire limitations.

# The Cervical Cancer Screening Process

76% of eligible patients are up to date on screening

47% with abnormal cervical cancer screen receive colposcopy within 3 months

Median time from biopsy to cancer treatment initiation 68.5 days

Opportunity to improve cancer outcomes

# Self-Collection Provides an Opportunity to Improve Early Detection

## Cervical Cancer Testing

Women and other individuals with a cervix at average risk of cervical cancer should start screening at **age 25 and continue until at least age 65**.

### Test options include:

- A primary HPV test (HPV test alone) on a cervical sample collected by a health care provider **every 5 years** (the preferred option).

A primary HPV test done on a self-collected vaginal sample **every 3 years**.

- A co-test (HPV test combined with a Pap test) **every 5 years**.
- A Pap test alone **every 3 years**, if HPV testing isn't available.

**Getting screened regularly is the most important thing, no matter which test you get.**  
Visit [cancer.org/getscreened](https://cancer.org/getscreened) to learn more.

Source: Perkins RB, Wolf AMD, Church TR, et al. Self-collected vaginal specimens for human papillomavirus testing and guidance on screening exit: An update to the American Cancer Society cervical cancer screening guideline. *CA Cancer J Clin.* 2025. doi.org/10.3322/caac.70041.

# ACS Recommendations Include Self-Collection

## Under Age 25

**Screening is not recommended.**

Cervical cancer is rare before age 25.

## Ages 25 to 65

**Get screened using a primary HPV test (HPV test alone) either:**

- On a cervical sample collected by a health care provider every 5 years (preferred) **or**
- On a self-collected vaginal sample every 3 years.

If primary HPV testing is not available, screening may be done with a co-test (both HPV and Pap) **every 5 years**, or a Pap test **every 3 years.\***

\*Getting screened regularly is the most important thing, no matter which test you get.

## Over Age 65

**Talk to your health care provider about stopping screening if you've been getting screened regularly.**

People can stop cervical cancer screening at age 65 if their most recent screening tests have been normal. This depends on the type of screening test that was used.

# Women's Preventive Services Guidelines

Type of Preventive Service	Current Guideline	Updated Guideline Beginning with Plan Years Starting in 2027
<b>Screening for Cervical Cancer</b>	<p>The WPSI recommends cervical cancer screening for average-risk women aged 21 to 65 years. For women aged 21 to 29 years, the Women's Preventive Services Initiative recommends cervical cancer screening using cervical cytology (Pap test) every 3 years. Cotesting with cytology and human papillomavirus testing is not recommended for women younger than 30 years. Women aged 30 to 65 should be screened with cytology and human papillomavirus testing every 5 years or cytology alone every 3 years. Women who are at average risk should not be screened more than once every 3 years.</p>	<p>The WPSI recommends cervical cancer screening for average-risk women aged 21 to 65 years. For women aged 21 to 29 years, cervical cancer screening using cervical cytology (Pap test) every 3 years is recommended. Co-testing with cytology and human papillomavirus (hrHPV) testing is not recommended for women younger than 30 years. Women aged 30 to 65 years should be screened with primary hrHPV testing every 5 years (preferred) or cytology and hrHPV testing (co-testing) every 5 years. If hrHPV testing is not available, continue screening with cytology alone every 3 years. Women who are at average risk should not be screened more than once every 3 years.</p> <p><b>Patient-collected hrHPV testing is an appropriate method and should be offered as an option for cervical cancer screening in women aged 30 to 65 years at average risk.</b></p> <p>on the initial screening. If additional testing (e.g., cytology, biopsy, colposcopy, extended genotyping, dual stain) and pathologic evaluation are indicated, these services also are recommended to complete the screening process for malignancies.</p>

# FDA-approved self-collection tests for primary HPV screening?

## Self-collection kits for the healthcare settings

Roche  
**cobas®**  
with Copan 522C.80 swab or  
Evalyn® Brush

BD  
**Onclarity™**  
with Copan 522C.80 swab

Abbott  
**Alinity M**  
with simpli-COLLECT™ HPV  
Collection Kit or Evalyn®  
Brush

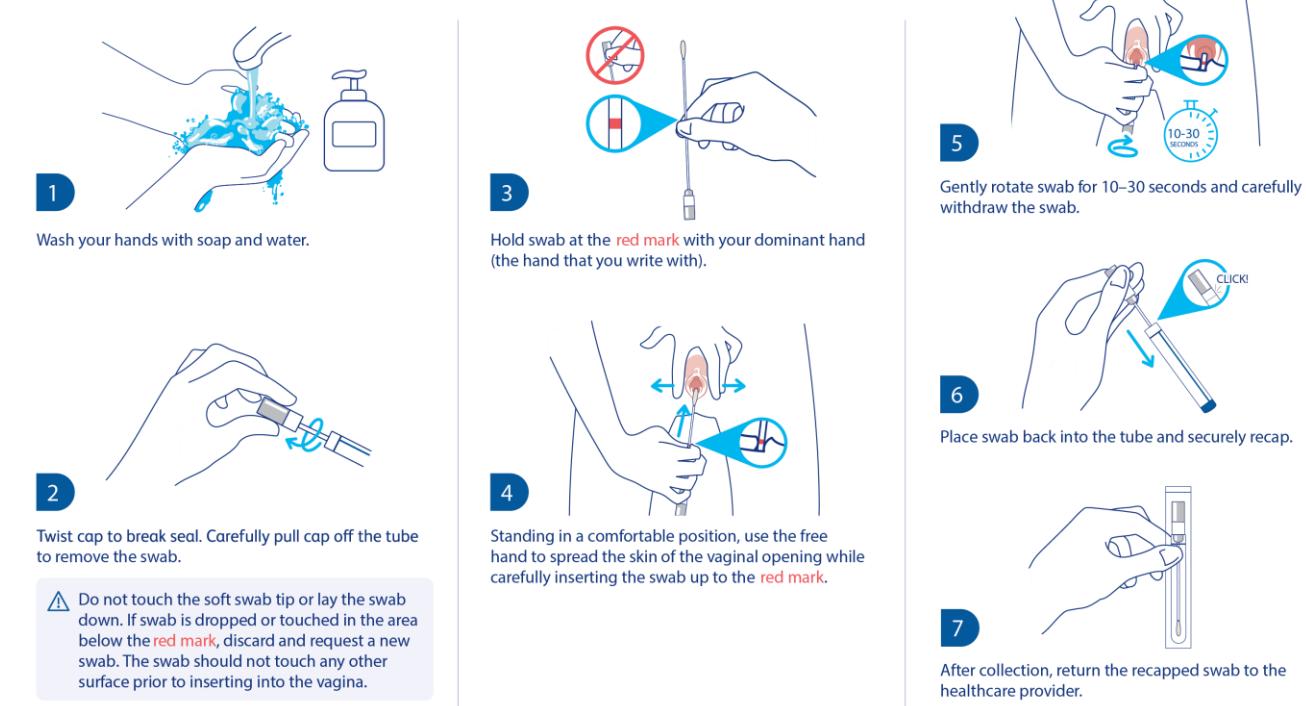

## Device for home collection

Teal Health  
**Teal Wand™**  
*\*in select states*

# How is HPV self-collection test done?

## In-clinic Patient Self-collection Steps for Copan Swab (device partnered with BD and Roche)

1. Wash hands
2. Open the swab carefully. Avoid touching the area below the **red mark** towards the tip.
3. Hold the swab at the red mark.
4. Use your other hand to spread the skin of the vaginal opening and carefully insert the swab into the vagina up to the red mark.
5. Gently rotate the swab for 10–30 seconds and then remove the swab.
6. Place the swab back in the tube and make sure the cap is secured.
7. Give your healthcare provider the recapped swab.

Pictures: adapted from Becton, Dickinson and Company (BD)

Not shown: Evalyn® brush approved for use with Roche

# HPV Self Collection Test Performance

**Three meta-analyses have been done to evaluate HPV self-collection testing**

- **More sensitive** at detecting CIN2+ than cytology alone in the first round of screening\*
- **Comparable sensitivity and high agreement** with clinician-collected primary HPV testing samples

ARTICLES | VOLUME 15, ISSUE 2, P172-183, FEBRUARY 2014

Accuracy of human papillomavirus testing on self-collected versus clinician-collected samples: a meta-analysis

Dr Marc Arbyn, DrTMH   • Freija Verdoort, PhD • Prof Peter J F Snijders, PhD • Viola M J Verhoef, MD • Eero Suonio, MD • Lena Dillner, PhD • et al. [Show all authors](#)

Detecting cervical precancer and reaching underscreened women by using HPV testing on self samples: updated meta-analyses

Marc Arbyn,<sup>1</sup> Sara B Smith,<sup>2</sup> Sarah Temin,<sup>3</sup> Farhana Sultana,<sup>4,5</sup> Philip Castle,<sup>2,6</sup> on behalf of the Collaboration on Self-Sampling and HPV Testing

INNOVATIVE TOOLS AND METHODS

Short Report

 INTERNATIONAL JOURNAL of CANCER 

Meta-analysis of agreement/concordance statistics in studies comparing self- vs clinician-collected samples for HPV testing in cervical cancer screening

Marc Arbyn<sup>1,2</sup>  | Philip E. Castle<sup>3,4</sup>  | Mark Schiffman<sup>4</sup> | Nicolas Wentzensen<sup>4</sup>  | Brandy Heckman-Stoddard<sup>3</sup> | Vikrant V. Sahasrabuddhe<sup>3</sup>  

\*although less specific, so better suited to a screening test; a more sensitive test is better at ruling out a condition-a negative result is likely a true negative, while a more specific test is better at ruling in a condition- a positive result is more likely to be a true positive

# HPV self-collection eligibility

## Patients who are eligible

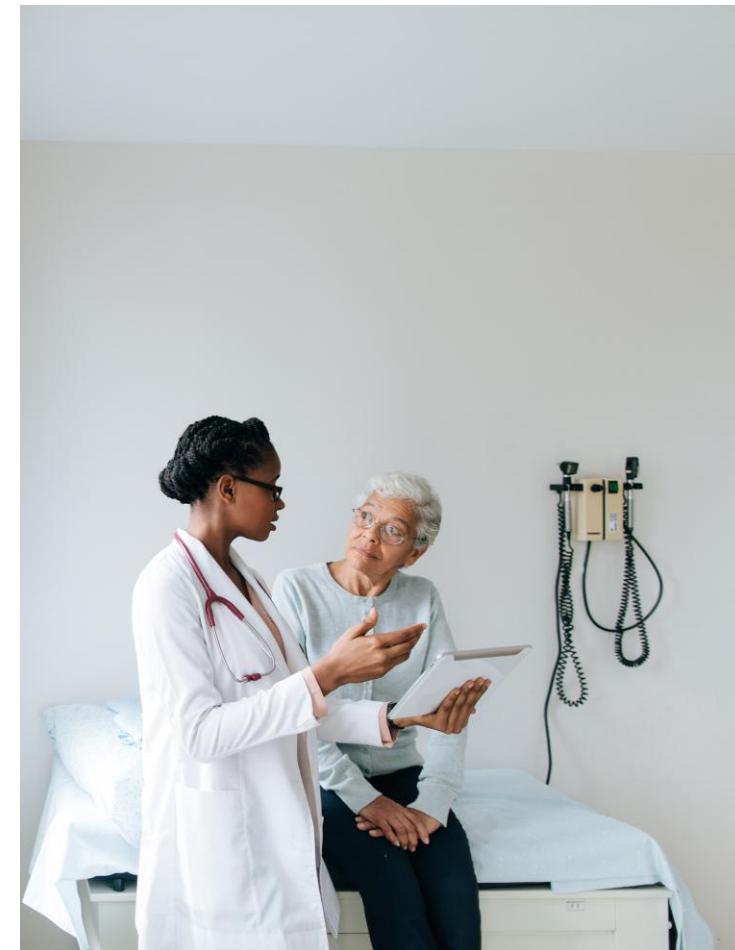

- Must be eligible for primary HPV testing

## Patients who should still have a clinician collected screening test

- HIV+ or other immunosuppression
- History of in utero DES exposure
- Other patients at high risk

## Other considerations

- Age under 30
- Medicare coverage

# Acceptability of Self Collection

**Patients report high acceptability of vaginal specimen collection across multiple settings**

## Benefits

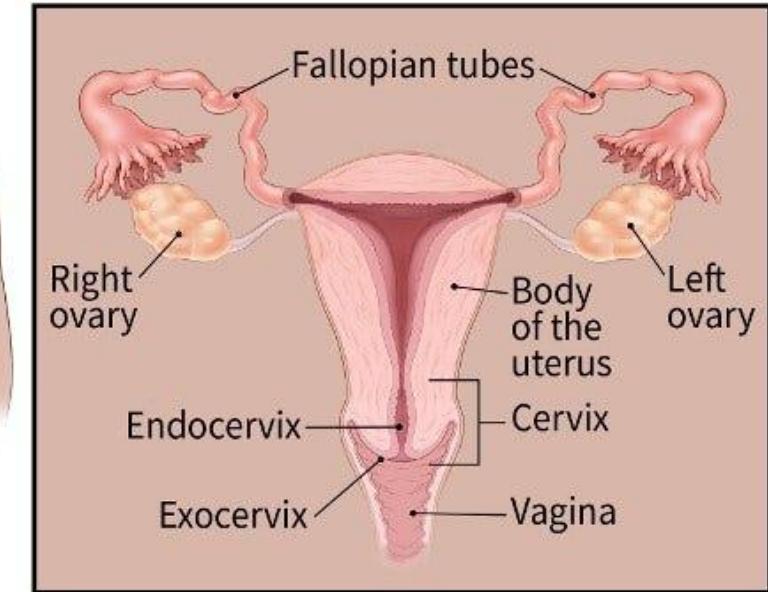

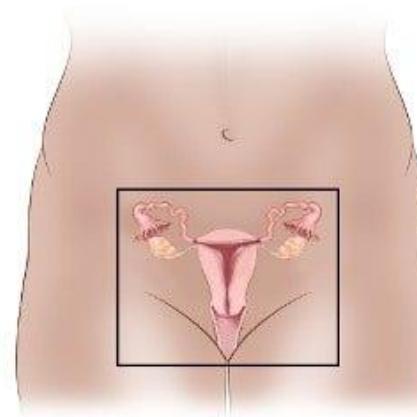

- Easy to perform
- No or less pain
- Privacy

## Harms

- Potential to miss physical exam findings

# Symptoms Still Need Clinical Evaluation

- Abnormal vaginal bleeding
  - post-coital
  - post-menopausal
  - irregular menses
  - menorrhagia
- Abnormal vaginal discharge
- Hematuria
- Dyspareunia
- Other pelvic pain

# Where cervical cancer screening can be performed

## Before Self-Collection

- Healthcare professional with training to do a pelvic exam
- Specialized office equipment
- Often required a standalone appointment

## After Self-Collection

- Any healthcare professional
- Can be part of another screening appointment, lab or radiology visit
- Any private setting

# The screening process with self-collection

More  
abnormal  
screenings  
may be  
identified

Referral needs will change within the system.  
Patient assistance must be available.

Opportunity to  
improve  
cancer  
outcomes

**Tom Hutch, MD, FAAFP, FASAM**  
Medical Director, We Care Daily Clinics  
Clinical Assistant Professor  
University of Washington  
Department of Family Medicine

# Contact Information

- ◆ Medical Director, We Care Daily Clinics
- ◆ Clinical Assistant Professor
  - ◆ Department of Family Medicine,  
University of Washington School of  
Medicine
- ◆ No Disclosures
- ◆ Email: [tomhutch@uw.edu](mailto:tomhutch@uw.edu)

# Funding and Support

- ◆ This work was made possible by a Catchment Area Pilot Project Award from the Cancer Consortium involving Fred Hutch, UW, and Seattle Children's. Their support allowed us to prove that this model works.
- ◆ NIH/NCI Cancer Center Support Grant P30 CA015704
- ◆ Clinical collaboration between We Care Daily Clinics and the Swisher Lab at University of Washington

# Project Setting

- ◆ Opioid Treatment Program (OTP) – An outpatient clinic offering medical services, counseling, and dispensed medication for opioid use disorder (such as methadone and buprenorphine) to people with substance use disorder (SUD)
- ◆ Ideal setting to provide cervical cancer screening to an under-screened, at-risk population
- ◆ Perceived stigma among those with SUD has often generated avoidance of healthcare interactions, leading to low receipt of primary preventive care<sup>1,2</sup>
- ◆ Individuals with SUD may have other risk factors for cervical cancer including tobacco use, non-vaccination for HPV, history of transactional sex, and history of sexual abuse<sup>3,4</sup>

# Project Setting

- ◆ We Care Daily Clinics
  - ◆ OTPs with brick-and-mortar and mobile clinics in Seattle region
  - ◆ Patients come to clinic with frequencies ranging from daily to monthly to receive medication and services

# Project Setting

## ◆ We Care Daily Clinics

- ◆ Medical management of SUD, hepatitis C, HIV, other STIs
  - ◆ Some procedures such as Nexplanon, but no facilities for gynecological services or exams
- ◆ Counseling services from SUD Professionals and Certified Peer Support Specialists
- ◆ About 1800 patients total, 200 of whom are served by mobile clinics

We Care Daily Clinics Patient Demographics	
	n=1775
Characteristic	%
Female	47
Female age 25-65 years	44 (n=726)
Race	
Asian	1
Black	8
American Indian/Alaska Native	9
Native Hawaiian/Pacific Islander	1
White	72
Declined/other	8
Hispanic Ethnicity	5

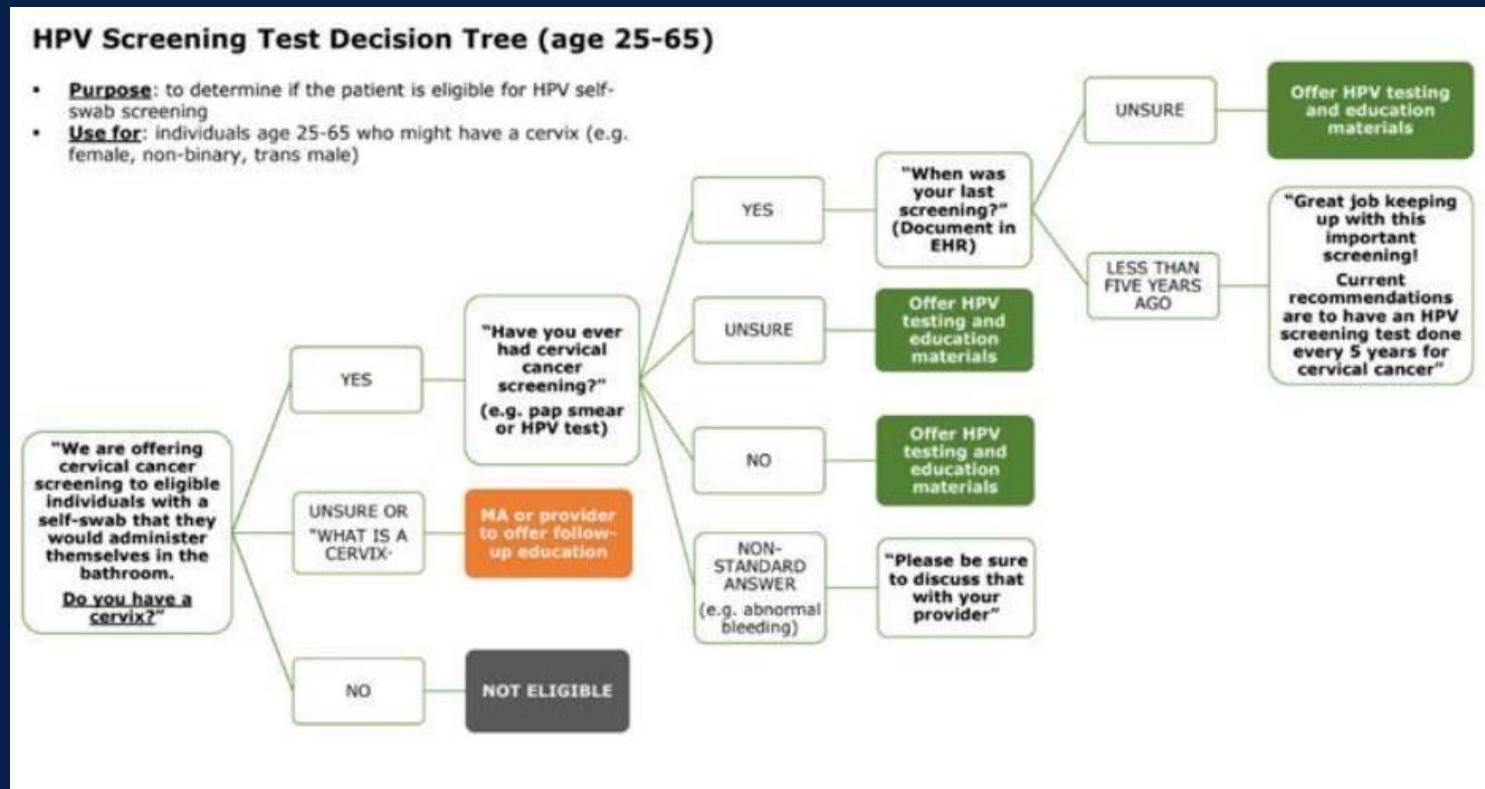

# Project Goals

- ◆ Introduce and evaluate a low-barrier model for integrating HPV self-collect cervical cancer screening into an opioid treatment program
- ◆ Measure current rates of screening and testing outcomes
- ◆ Assess acceptability to clients
- ◆ Facilitate referral and follow-up

# Project Workflows

- ◆ Medical Assistants identify candidates ahead of Annual Medical Update visit, offer testing per decision tree:

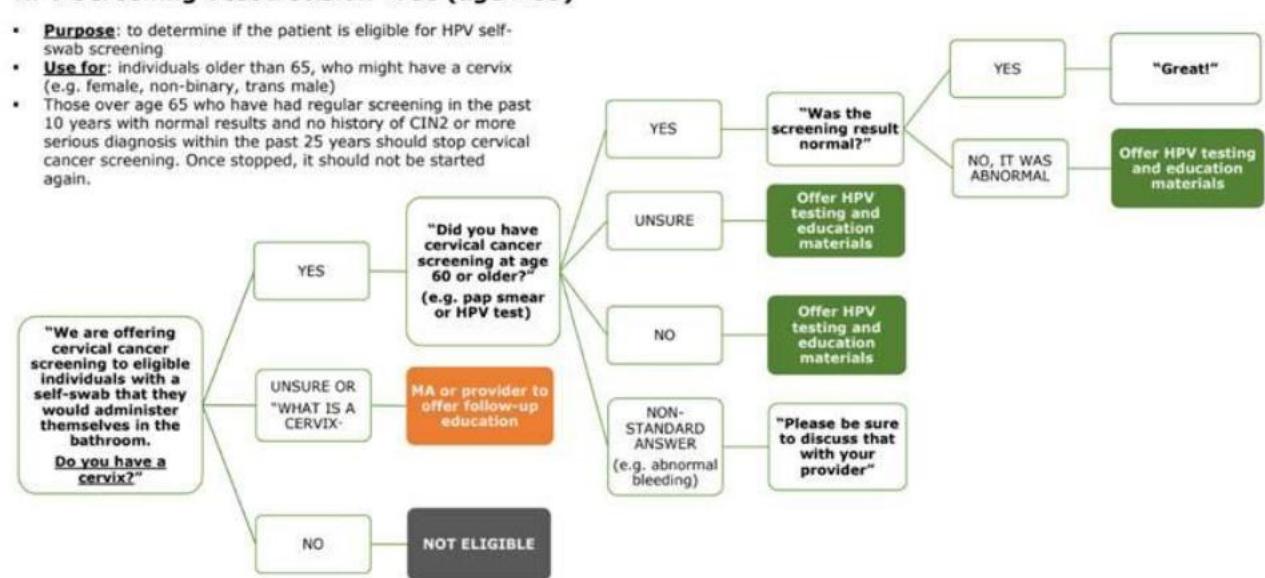

# Project Workflows

- ◆ Additional decision trees: Those >65 years old; vaccination questionnaire:

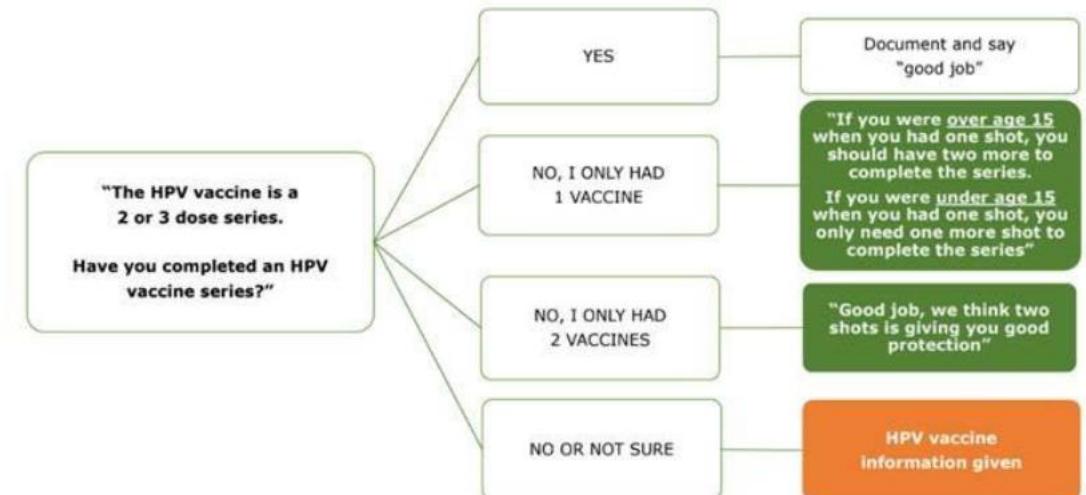

## HPV Screening Test Decision Tree (age >65)

- **Purpose:** to determine if the patient is eligible for HPV self-swab screening.
- **Use for:** individuals older than 65, who might have a cervix (e.g. female, non-binary, trans male)
- Those over age 65 who have had regular screening in the past 10 years with normal results and no history of CIN2 or more serious diagnosis within the past 25 years should stop cervical cancer screening. Once stopped, it should not be started again.

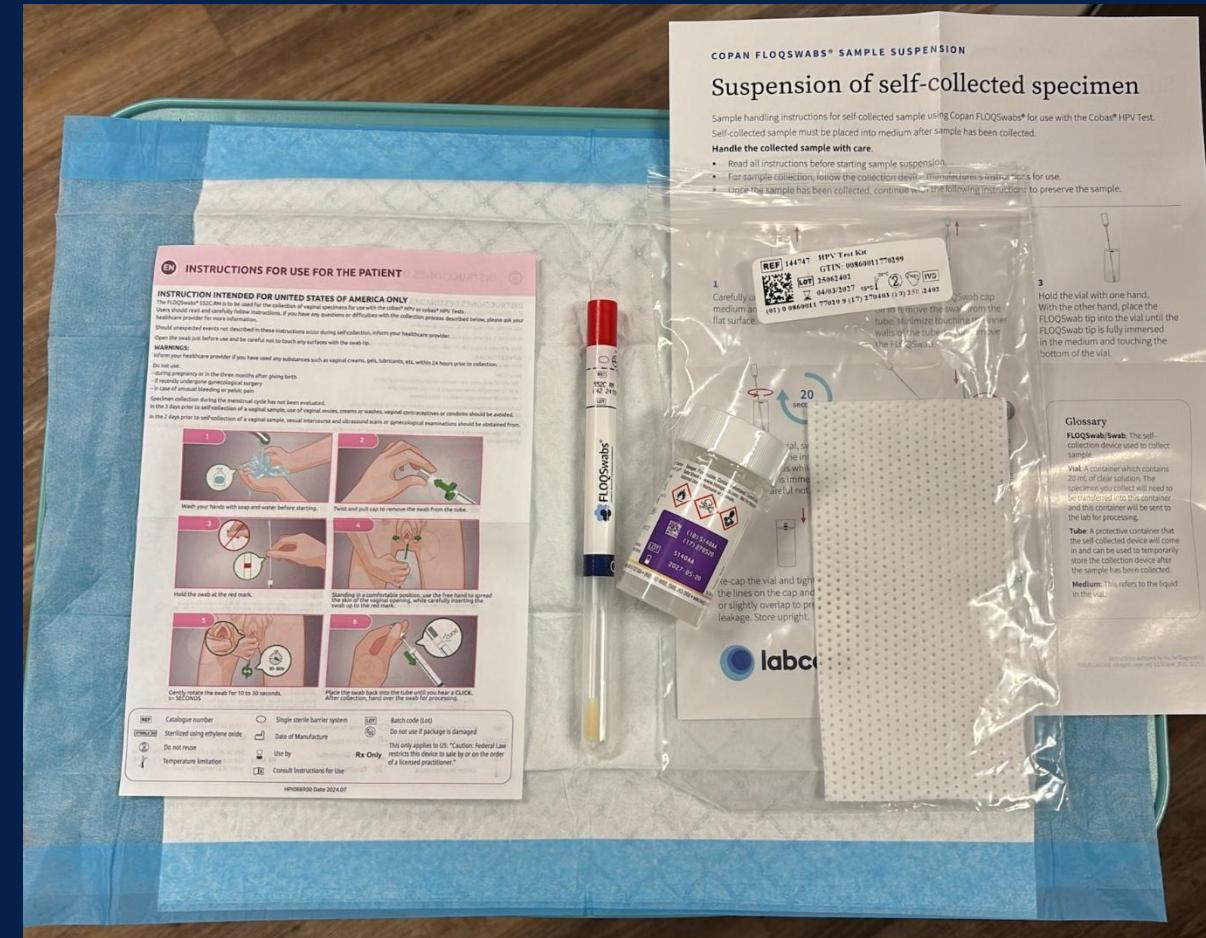

## HPV Vaccination Questionnaire Decision Tree (age 26 or younger)

- **Purpose:** to determine vaccination status
- **Use for:** all individuals age 26 or younger

# Project Workflows

- ◆ Eligible patients were offered a kit for self-collection, instructions in English or Spanish, and a diagram of collection technique
  - ◆ Completed in facility restroom, concordant with routine urine testing
  - ◆ Those who were eligible but uncertain about proceeding were encouraged to discuss further with medical provider at that day's visit
  - ◆ Written info on HPV testing and cervical cancer screening from CDC was provided

# Project Workflows

- ◆ HPV tests were sent to UW Molecular Diagnostics Laboratory in twice weekly batches (6/2024-8/2025) or to Labcorp (9/2025 - present) for testing with Roche cobas® HPV test (FDA-approved for self-collection within a healthcare setting 5/2024)

# Project Workflows

- ◆ Negative results via personalized letters handed to patients during routine visits, typically within a week of result
- ◆ Positive results prompted in-person medical consultations, with multi-modal outreach (phone/text/email) for missed appointments
- ◆ Management followed ASCCP risk-based consensus guidelines, referring patients testing positive for HPV-16/18 directly to colposcopy, while those with other hrHPV types were referred for cervical cytology
- ◆ Navigation system using EHR reminders to prompt provider chart reviews at one and four weeks post-referral to verify appointment scheduling and attendance

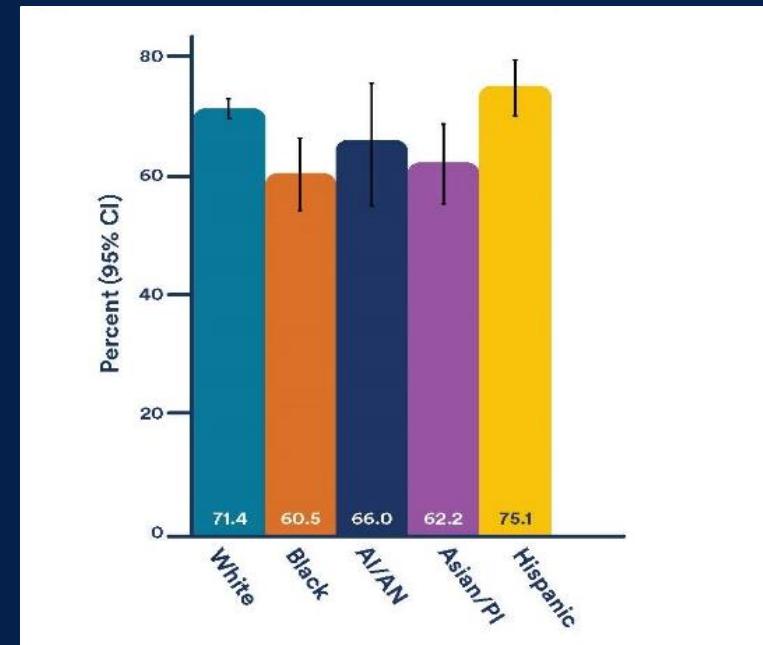

# Linkage to Care

- ◆ Those with SUD report high rates of sexual abuse histories, which can make follow-up testing traumatic<sup>3,4</sup>
- ◆ We identified a list of trauma-informed gynecologic care providers in a variety of locations
- ◆ WCDC providers sent referrals detailing HPV results and request for follow-up testing
- ◆ To address logistical and psychosocial hurdles, the clinic provided free patient transportation to referral partners and offered Certified Peer Support Specialist accompaniment to off-site gynecologic appointments for emotional support

# Addressing Health Equity

- ◆ Most HPV self-collect studies have taken place within healthcare systems that already provide cervical cancer screening with provider-collected samples<sup>7</sup>
- ◆ New clients with SUD often present with multiple medical and social issues including active withdrawal
- ◆ Bringing screening to patients in a setting where they already feel safe and respected can help to bypass structural barriers that lead to mortality disparities

Prevalence of up-to-date cervical cancer screening by race and ethnicity in WA<sup>5</sup>

# Conclusion: You Can Do This!

- ◆ Incorporation of cervical cancer screening into a relatively small clinic with no gynecological services was feasible and acceptable with high patient eligibility and uptake
- ◆ HPV self-collect tests can expand cervical cancer screening into clinics to reach under-screened patients, which should reduce health care disparities and cervical cancer mortality

# Questions and Acknowledgments

- ◆ Acknowledgments and thanks:
  - ◆ Our patients

# 2026 RURAL LEARNING COMMUNITY

The 2026 rural learning community will provide practical strategies and peer-based learning to help participants implement evidence-based interventions that strengthen cancer prevention and screening efforts in their clinics and communities.

Topics to be explored include:

- From Colon to Cervical: Best Practices with Self-Collection Testing
- Bridge the Gap: HPV Partnerships & Pathways That Work
- From Start to Finish: HPV Series Completion in Rural Communities
- Small Media, Big Impact: Boosting HPV Vaccination in Rural Communities
- Measuring What Matters: HPV Report Cards for Clinics and Provider

Sessions will occur the **2nd Wednesday of every month** (March-November 2026)

**Time:** 2-3pm EST

**Location:** Zoom meeting

**Register here**

If you have any questions about the learning community, please reach out to [Ashley.Lach@cancer.org](mailto:Ashley.Lach@cancer.org)
